Human trafficking organizations memphis

"I'm so glad I don't have to be alone anymore." Get Involved» Are you in danger? Call us at 901-409-6586 » We exist to eradicate human trafficking by empowering survivors, equipping communities, and seeking justice through systemic change. The Problem 30 Million people live as slaves in the world today. Human trafficking is modern day slavery. Each year over 100,000 Children are estimated to be exploited in the United States. Over 100 Cases of sex trafficking of minors and adults are identified in Shelby County every year Learn More Along with the policy briefs that the WFGM published nationally and locally, we have deepened our partnership with the Women's Funding Network to actively engage women's funds across the country in key policy debates, including information sessions, op-ed and letter writing campaigns, meeting with policy makers and grant-making. We have emphasized the linkage between our national work and the on-the-ground work of our grantee partners and the women they serve. We have conducted a series of policy meetings and forums that bring together our extensive network of opinions leaders. Discussions with policy experts and key staff of the Obama administration including the White House Council for Women and Girls, has solidified the validity and timeliness of our work and the national agenda. Our Advocacy in Action The Women's Foundation for a Greater Memphis along with its sister funds from the Tennessee Women's Fund Alliance are working on the front lines to end human trafficking in Tennessee. The state took a lead in the battle against sex trafficking by passing 14 of the most progressive anti-human trafficking legislation in the country. Learn the details of each bill ... If you suspect someone is a victim, or you witness activity you believe to be related to sex trafficking, call the Tennessee Human Trafficking Resource Center Hotline at 1-855-55-TNHFH. Please visit StopSexTraffickingInTN.com for more information. This email address is being protected from spambots. You need JavaScript enabled to view it. Tennessee Leads the Nation with Toughest Human Trafficking Laws Tennessee has developed a strong legislative agenda to prevent human trafficking. Shared Hope International is a national organization that supports the development of global, federal and state policies and legislation, rated Tennessee at 93.5 to lead ALL STATES in the nation for tough trafficking laws. See the report card.... Please listen to Kimberly Benson, Director of A Bridge of Hope, talk about her own experience and what she is doing in the Memphis community. Memphis Organizations Fighting Human TraffickingA Way Out - Christian program in the Memphis area to assist any woman desiring to permanently leave sex trafficking Corps - An interdenominational, Gospel-centered team whose mission is to eradicate human trafficking by empowering survivors, equipping communities, and seeking justice through systemic change. Mercy Multiplied BooksA Way of Escape by Neil Anderson (sexual addiction)False Intimacy by Dr. Harry Schaumburg (pornography)I Surrender All: Rebuilding a Marriage Broken by Pornography by Clay and Renee Crosse (marriage restoration)In Our Backyard: Human Trafficking in America and What We Can Do to Stop It by Nita Belles (Awareness) Accountability SoftwareCovenantEyes.com - Internet and Screen Accountability and Filtering Software We exist to eradicate human trafficking by empowering survivors, equipping communities, and seeking justice through systemic change. To see a slave free community through the rehabilitation and empowerment of survivors and a community galvanized against human trafficking. We are an interdenominational, Gospel-centered team. We believe God created all people in His image to know Him, love Him and glorify Him. We believe violence destroys hope, and true restoration involves men and women knowing the fullness and significance of their humanity and identity with Christ. We strive to glorify God by working alongside the Memphis community on behalf of the exploited. Restore Corps provides assistance to victims of trafficking regardless of their religious beliefs, ethnicity, or gender, and we are grateful for the support of all people of good will. Read the full list of our Corps Values here. Read Memphis Leadership Foundation's Statement of Faith Here. Our team of abolitionists began as the anti-trafficking team of Operation Broken Silence in 2010. We authored and gained sponsorship for nineteen legislative changes all of which are now in effect. Under these legislative changes, Tennessee is recognized nationally as the leading state in anti-trafficking law. Restore Corps is composed of the former anti trafficking team of Operation Broken Silence along with some additional staff and volunteers that have joined along the way. Currently, we serve as the regional point of contact for west Tennessee. We provide wrap-around, trauma informed, strengths based case management services for any human trafficking referrals in the 21 counties in West Tennessee. We work to eradicate human trafficking by empowering survivors, training the community, and changing systems to create provisions for victims and increase risks to the buyer and exploiter. OUR MISSION:Advocate, Rescue, Restore. A Way Out is without a doubt the best resource I have in the state for young women being trafficked. — Judge Mark L. Agee, Gibson County, TN General Sessions Court Our heart is to restore lives and to glorify God by recognizing the innate value and dignity of every person. Sexual exploitation and trafficking has devastating effects on everyone involved, and is a hidden but very present issue in the city of Memphis. A Way Out Ministries exists to disrupt this vicious cycle by advocating for protections and legal justice for those trapped in the sex industry, helping victims' lives to be rescued and restored, and raising awareness for how sexually explicit content is harmful to both the subject and the viewer. While prostitution tends to take place in hidden places, its negative impacts can be felt across our culture and in our communities. We believe that seeing every person as made in the image of God requires that they be treated with dignity, respect, and value. We work to restore lives destroyed by sexual exploitation and seek to prevent future abuse by being proactive in advocacy and raising awareness. While most people are unaware of how prevalent sexual exploitation is, the dangers of it are present and real : 244,000 - 325,000 American youth are considered at risk for sexual exploitation 1 out of 3 teens on the street will be lured toward sex trafficking within only 48 hours of running away from home An estimated 199,000 incidents of sexual exploitation of minors occur yearly in USWho We Serve Theresa's Story / Read Her Story Our work is funded through the generous contributions of individuals, companies, churches, and foundations. Financial donations are accepted via mail or our secure online portal. Individuals can be involved in supporting and encouraging our clients as they walk down the path of healing in many ways - such as mentoring, teaching, or even making a meal. On April 9, 2022 we will be hosting a Paint Party at Crosstown Concourse as a fundraiser and awareness event. To get your ticket and for more information, please learn more It's not as horrific as forced prostitution, certainly, but it's still disturbing to learn that the global scourge of human trafficking has penetrated the beauty salon business. A man from Togo has admitted in court that he smuggled at least 20 girls and women from his West African homeland into the United States and put them to work braiding hair at several New Jersey salons. The braiders work on duty up to 14 hours a day, seven days a week, and were forbidden to go outside without permission, learn English or make new friends—and were beaten if they disobeyed, according to the prosecutor. They were also forced to fork over every cent they earned to the man and others in the smuggling ring. Not beautiful at all.MORE ON ALLURE.COM: 10 Easy Summer Hairstyles: Editors' Best Hair Secrets: The 13 Best Cuts in Hollywood: Daily Beauty Reporter: Brazilian Hair Straightening: Daily Beauty Reporter: 5 Ways To Protect Your Haircolor Photo Courtesy: Susanne Jutzeler, suju-foto/Pixabay Most people are aware that primates are the closest living relatives to humans. Chimpanzees, gorillas, gibbons, orangutans and other monkeys all have unique characteristics, but together we are all part of the same order of mammals, Primatomorpha. This distinct order of primates has evolved in different ways, but their behaviors and even their looks reveal some similarities to modern humans. When it comes down to the finer points — certain habits, emotions, reactions and physical developments — what's the truth about how similar we are to primates?How Were Humans and Primates First Linked?As a species, we have come a long way in 25 million years. Evolutionary specialists, starting with Charles Darwin, have suggested humans evolved from other animals around 150 years ago. This theory was met with indignation by some people, but as more scientific evidence was studied, the similarities between humans and primates became too much to ignore. Photo Courtesy: stux/Pixabay From familial behaviors, patterns of learning and tendencies to hunt for food to their desire to provide for others in their group and even show human-like emotions (loneliness, happiness, etc.), humans and primates have a lot of obvious things in common. Taking it to a biological level, archaeological evidence also shows that primate skeletons look remarkably similar to human skeletons throughout the various stages of evolution.Modern human brains evolved to be larger than primates, but our brains are structurally similar to that of a chimpanzee. And we're not just talking about skull shape. We're talking about cortical areas of reasoning, abstract thought and problem-solving. Photo Courtesy: Barny/Pixabay In essence, if our primate cousins had the physical ability to speak our language — their mouth and vocal cords aren't developed like ours — then they could talk to us about love, heartache, irritation and happiness. They might even have a sense of humor and tell us jokes!What Other Physical Similarities Do We Have?Sticking to the physical similarities for now, one of the most obvious similarities is that most primates can walk on two legs, just like humans. Their feet are more hand-like, which allows them to more easily jump and swing through their natural tree-based habitats. They also use their actual hands for many of the same things that humans do. Photo Courtesy: Vinsky2002/Pixabay This includes gesturing to others, eating, grooming and even pointing and using rudimentary tools. As studies continue into their behavior, we may discover that humans' similarities to primates go far beyond our genetic make-up.Which Primate Is Most Similar to Humans?In terms of physical characteristics and behavior, the chimpanzee is the most similar primate to humans. Geneticists say that chimps share about 98.6% of their DNA with humans. This is significantly more than monkeys and other great apes. Photo Courtesy: suju/Pixabay A study from Science Daily found that chimpanzees share 60% of their personality traits with humans too! This includes things like openness (honesty), extroversion and agreeableness. Of course, humans and chimps don't have tails like many other primates, although some humans might agree that a tail would be a pretty cool physical addition!Who Conducted the Earliest Studies?Naturally, when humans became more interested — and more convinced — in the similarities between primates and humans, experiments began in a new field of study known as primatology. Many early studies didn't follow acceptable practices to get answers, but science has come a long way, and many ethical studies in recent years have produced some fascinating results. Photo Courtesy: suju/Pixabay Jane Goodall is one of the leading specialists in primatology. She moved to what was then Tanzania in 1960 at the age of 26 to learn more about chimpanzees. Studying these primates became her life's passion, and she spent more than 55 years observing their unique and individual personalities.Did Primates Travel in Space?Sadly, the similarities between primates and humans are so significant that primates were sent into space as test subjects to see if humans could survive the travel conditions. The first primate astronaut, a rhesus macaque called Albert, was sent up to an altitude of 39 miles in a rocket ship in 1948 and died from suffocation. Photo Courtesy: NASA/Wikimedia Commons A year later, Albert II was sent on a similar flight, and the parachute failed. The first monkeys to survive space travel were Able and Miss Baker, a squirrel monkey and a rhesus macaque, who made it back alive in 1959. They flew at an altitude of 360 miles aboard a Jupiter rocket.Do They Have Emotions Like Us?Humans convey so much through their facial expressions, and those expressions are seen as uniquely human attributes to convey when we're happy, sad, angry, excited and more. Primates don't have the same range or the same in depth meaning for facial expressions, but they do have other ways of showing their emotions. Photo Courtesy: PublicDomainPictures/Pixabay While a chimp's fierce, teeth-baring "smile" is obviously a sign to go away and leave them alone, a slight grimace with the mouth corners pulled back usually shows subservience. Most other expressions are vocalized with grunts, shrieks and hoots as well as body language.Will Primates Do Tricks or Trade for Food?What better way to bribe someone than with food? Humans are guilty of promising their children food treats as rewards for good behavior, and monkey trainers — and all kinds of other animal trainers — often enjoy great success using food as rewards during training. Photo Courtesy: Pixel-mixer/Pixabay Primates have also been observed to understand the concept of using currency in exchange for food. A study at Yale New Haven Hospital trained capuchin monkeys to exchange silver discs for grapes — but that wasn't all they learned. The researchers were stunned when female monkeys started exchanging sex to get silver discs from male monkeys so they could get more grapes!What About Junk Food?Unfortunately, primates seem to have developed the same affinity for junk food as humans. In parts of India and Africa where fast food joints have cropped up over the years, wild primates have been observed rooting through trash to find leftover chips and fried chicken to munch on. Photo Courtesy: chpek/Pixabay Like humans, primates also prefer cooked food. In a Harvard study, researchers found that chimpanzees understand that the taste and composition of foods change during the cooking process. If given a heating apparatus, they learn to cook foods like meats and potatoes and appear to prefer it.Do They Know Right from Wrong?The ability to distinguish between right and wrong is considered to be a concept that is unique to humans and learned in the formative childhood years. However, studies like one conducted by the University of Zurich show chimpanzees are well aware of what behaviors are appropriate. Photo Courtesy: christels/Pixabay Part of the study showed that if a chimp watched scenes of a baby chimp being harmed by another chimp, it showed signs of anger and defensiveness. However, if the chimp saw adult chimps fighting one another, the reaction wasn't the same. This showed they knew it was wrong for a stronger adult chimp to hurt a defenseless youngster.Do Primates Recognize Faces?Remarkably, primates have been observed to recognize their own faces when they are handed a mirror and look at it, which is something very few other animals can do. This shows that primates do have a sense of self like humans do. Photo Courtesy: a m o u t o n/Pixabay Additionally, primates can also recognize their friends in photos. A study published in the Proceedings of the National Academy of Sciences showed that capuchin monkeys could identify members of their "in-group" on a touch screen when displayed among similar looking members of an "out-group."Can Primates Understand Humans?So, we have established that primates, particularly chimpanzees, do indeed experience the world similar to the way humans do. Using similar senses as our own, including touch, hearing, smell and sight, they enjoy food, fun, social interaction with friends and many other things considered "human." Photo Courtesy: Mylene2401/Pixabay Although their mouths and vocal cords aren't formed to speak like humans, they exhibit similar body language and an ability to read human facial expressions and decipher vocal pitch, which helps them understand what we are trying to express. Many primates have been observed to learn certain words and commands too.Can They Learn Sign Language?Among their own social groups, primates use vocalizations and body language to communicate with each other. This includes hugging, grooming, patting, hand-holding and fist-shaking. Even more impressive, they can use body language and sign language to communicate with humans. Koko the gorilla is probably the best-known example of a primate that was taught sign language. Photo Courtesy: suju/Pixabay She knows around a thousand signs and shows a good understanding of spoken English. It is estimated that Koko has an IQ level of up to 95 — the average human IQ is 100. Like many of us humans, she is also a fan of kittens!What Makes Primates Laugh?Primates have been observed to show a range of positive emotions, from relaxed facial expressions to bursting into laughter and rolling around on the floor! As laughter signals a sense of humor and understanding that something is funny, it's remarkable that this trait is shared between primates and humans. Photo Courtesy: Foto-Rabe/Pixabay Chimpanzees laugh when tickled by other chimps, animals or humans. Interestingly, their ticklish spots are usually the same places as humans: near the underarms and belly. Primates have also been observed to laugh when laughing, chasing and wrestling.How Do Primates Learn?Just like us humans, the formative years of a primate's life are all about learning. In particular, the first five years of a chimp's life are the most important time for learning, and they do it through play, copying relatives — especially their mother — and socializing with other chimps. Photo Courtesy: skeeze/Pixabay Not only does this learning build on the innate tools for basic survival — finding food, getting shelter and so on — but primates also learn new things that are useful. This includes learning how to use new tools to access food and, as mentioned above, learning how to cook.Do They Have Playmates?Human children spend hours running around playing and having fun — and so do the adorable babies of primates. For most animals, playful behavior such as play fighting is a kind of practice for real-life, adult situations. Photo courtesy: gqadian/Pixabay However, scientists at the University of Pisa discovered that primate babies and young adults play purely for the fun of it and have playmates that help them form stronger social relationships as well as better attitudes toward being part of a community. Also, like human versions, primate games have been found to have a competitive edge, particularly as they start to get older.Do Primates Play with Toys?Primates have been observed to play with sticks, stones and other things in nature. When given human toys, they relish the opportunity to play with them. In a remarkable study conducted by Kim Wallen, a psychologist at Yerkes National Primate Research Center in Atlanta, Georgia, rhesus monkeys actually chose gender-specific toys. Photo Courtesy: Alexas Fotos/Pixabay The primates were offered "masculine" wheeled toys, such as toy cars, and more "feminine" plush toys, such as dolls. In general, the male monkeys opted to play with wheeled toys over the dolls. Interestingly, the female monkeys played with both kinds of toys.Do Primates Get Angry Like Humans?It has been regularly observed that primates can become angry and irritated, which is a typical fear or dominance response. Furthermore, primates, particularly chimpanzees, are the only species besides humans that have been observed in studies spanning 50 years to make coordinated attacks on other members of their own species. Photo Courtesy: skeeze/Pixabay This is akin to starting a war. As with humans, this is often done as a territorial strategy, with predominantly males showing aggression toward males from rival communities nearby. Chimps can also make and use weapons from stone and sticks.Do Primates Express Control and Calm?Biologists in the U.S. studied primates by using a game of "Ultimatum" and discovered that they share the same aversion to injustice as humans do. In the game, where equality prevails over benefits, the chimps would make fair offers and only accept fine and egalitarian offers from their peers. Photo Courtesy: pen_ash/Pixabay This is ultimately because cooperation benefits them and their wider community. It also shows that given a choice, primates will choose fairness and consideration over resorting to violence, showing that they know when to calm themselves and when to encourage measured choices and reactions.Do They Get Protective Like Humans?Monkeys do indeed get highly protective. This often applies to basic things such as food and environment, including not allowing other animals or rival primates to invade their territory and steal their food. Most significantly though, it applies to their protectiveness of their young. Adult primates have been known to learn certain words and commands too.Can They Learn Sign Language?Among their own social groups, primates use vocalizations and body language to communicate with each other. This includes hugging, grooming, patting, hand-holding and fist-shaking. Even more impressive, they can use body language and sign language to communicate with humans. Koko the gorilla is probably the best-known example of a primate that was taught sign language. In particular, the first five years of a chimp's life are the most important time for learning, and they do it through play, copying relatives — especially their mother — and socializing with other chimps. Photo Courtesy: skeeze/Pixabay Not only does this learning build on the innate tools for basic survival — finding food, getting shelter and so on — but primates also learn new things that are useful. This includes learning how to use new tools to access food and, as mentioned above, learning how to cook.Do They Have Playmates?Human children spend hours running around playing and having fun — and so do the adorable babies of primates. For most animals, playful behavior such as play fighting is a kind of practice for real-life, adult situations. Photo courtesy: gqadian/Pixabay However, scientists at the University of Pisa discovered that primate babies and young adults play purely for the fun of it and have playmates that help them form stronger social relationships as well as better attitudes toward being part of a community. Also, like human versions, primate games have been found to have a competitive edge, particularly as they start to get older.Do Primates Play with Toys?Primates have been observed to play with sticks, stones and other things in nature. When given human toys, they relish the opportunity to play with them. In a remarkable study conducted by Kim Wallen, a psychologist at Yerkes National Primate Research Center in Atlanta, Georgia, rhesus monkeys actually chose gender-specific toys. Photo Courtesy: Alexas Fotos/Pixabay The primates were offered "masculine" wheeled toys, such as toy cars, and more "feminine" plush toys, such as dolls. In general, the male monkeys opted to play with wheeled toys over the dolls. Interestingly, the female monkeys played with both kinds of toys.Do Primates Get Angry Like Humans?It has been regularly observed that primates can become angry and irritated, which is a typical fear or dominance response. Furthermore, primates, particularly chimpanzees, are the only species besides humans that have been observed in studies spanning 50 years to make coordinated attacks on other members of their own species. Photo Courtesy: skeeze/Pixabay This is akin to starting a war. As with humans, this is often done as a territorial strategy, with predominantly males showing aggression toward males from rival communities nearby. Chimps can also make and use weapons from stone and sticks.Do Primates Express Control and Calm?Biologists in the U.S. studied primates by using a game of "Ultimatum" and discovered that they share the same aversion to injustice as humans do. In the game, where equality prevails over benefits, the chimps would make fair offers and only accept fine and egalitarian offers from their peers. Photo Courtesy: pen_ash/Pixabay This is ultimately because cooperation benefits them and their wider community. It also shows that given a choice, primates will choose fairness and consideration over resorting to violence, showing that they know when to calm themselves and when to encourage measured choices and reactions.Do They Get Protective Like Humans?Monkeys do indeed get highly protective. This often applies to basic things such as food and environment, including not allowing other animals or rival primates to invade their territory and steal their food. Most significantly though, it applies to their protectiveness of their young. Adult primates have been known to learn certain words and commands too.Can They Learn Sign Language?Among their own social groups, primates use vocalizations and body language to communicate with each other. This includes hugging, grooming, patting, hand-holding and fist-shaking. Even more impressive, they can use body language and sign language to communicate with humans. Koko the gorilla is probably the best-known example of a primate that was taught sign language. Photo Courtesy: suju/Pixabay She knows around a thousand signs and shows a good understanding of spoken English. It is estimated that Koko has an IQ level of up to 95 — the average human IQ is 100. Like many of us humans, she is also a fan of kittens!What Makes Primates Laugh?Primates have been observed to show a range of positive emotions, from relaxed facial expressions to bursting into laughter and rolling around on the floor! As laughter signals a sense of humor and understanding that something is funny, it's remarkable that this trait is shared between primates and humans. Photo Courtesy: Foto-Rabe/Pixabay Chimpanzees laugh when tickled by other chimps, animals or humans. Interestingly, their ticklish spots are usually the same places as humans: near the underarms and belly. Primates have also been observed to laugh when laughing, chasing and wrestling.How Do Primates Learn?Just like us humans, the formative years of a primate's life are all about learning. In particular, the first five years of a chimp's life are the most important time for learning, and they do it through play, copying relatives — especially their mother — and socializing with other chimps.
